## Have seen so far

- Algorithms for various problems
  - Running times  $O(nm^2)$ ,  $O(n^2)$ ,  $O(n \log n)$ ,  $O(n)$ , etc.
  - I.e., polynomial in the input size
- Can we solve all (or most of) interesting problems in polynomial time ?
- Not really...

4/16/09

CS 5633 Analysis of Algorithms

2

## Example difficult problem

- Traveling Salesperson Problem (TSP)
  - **Input:** Undirected graph with lengths on edges
  - **Output:** Shortest tour that visits each vertex exactly once
- Best known algorithm:  $O(n 2^n)$  time.

4/16/09

CS 5633 Analysis of Algorithms

3

## Another difficult problem

- Clique:
  - **Input:** Undirected graph  $G=(V,E)$
  - **Output:** Largest subset  $C$  of  $V$  such that every pair of vertices in  $C$  has an edge between them ( $C$  is called a *clique*)
- Best known algorithm:  $O(n 2^n)$  time

4/16/09

CS 5633 Analysis of Algorithms

4

## What can we do ?

- Spend more time designing algorithms for those problems
  - People tried for a few decades, no luck
- Prove there is **no** polynomial time algorithm for those problems
  - Would be great
  - Seems *really* difficult
  - Best lower bounds for “natural” problems:
    - $\Omega(n^2)$  for restricted computational models
    - $4.5n$  for unrestricted computational models

4/16/09

CS 5633 Analysis of Algorithms

5

## What else can we do ?

- Show that those hard problems are essentially equivalent. I.e., if we can solve one of them in polynomial time, then all others can be solved in polynomial time as well.
- Works for at least 10 000 hard problems

4/16/09

CS 5633 Analysis of Algorithms

6

## The benefits of equivalence

- Combines research efforts
- If one problem has polynomial time solution, then all of them do
- More realistically:  
Once an exponential **lower bound** is shown for one problem, it holds for all of them

4/16/09

CS 5633 Analysis of Algorithms

7

## Summing up

- If we show that a problem  $\Pi$  is equivalent to ten thousand other well studied problems without efficient algorithms, then we get a very strong evidence that  $\Pi$  is hard.
- We need to:
  - Identify the class of problems of interest
  - Define the notion of equivalence
  - Prove the equivalence(s)

4/16/09

CS 5633 Analysis of Algorithms

8

## Class of problems: NP

- Decision problems: answer YES or NO. E.g., "is there a tour of length  $\leq K$ " ?
- Solvable in *non-deterministic polynomial* time:
  - Intuitively: the solution can be **verified** in polynomial time
  - E.g., if someone gives us a tour  $T$ , we can verify in *polynomial* time if  $T$  is a tour of length  $\leq K$ .
- Therefore, the decision variant of TSP is in NP.

## Decision problem vs. optimization problem

### 3 variants of Clique:

- 1. Input:** Undirected graph  $G=(V,E)$ , and an integer  $k \geq 0$ .  
**Output:** Does  $G$  contain a clique of  $C$  such that  $|C| \geq k$  ?
  - 2. Input:** Undirected graph  $G=(V,E)$   
**Output:** Largest integer  $k$  such that  $G$  contains a clique  $C$  with  $|C|=k$ .
  - 3. Input:** Undirected graph  $G=(V,E)$   
**Output:** Largest clique  $C$  of  $V$ .
3. is harder than 2. is harder than 1. So, if we reason about the decision problem (1.), and can show that it is hard, then the others are hard as well. Also, every algorithm for 3. can solve 2. and 1. as well.

## Decision problem vs. optimization problem (cont.)

### Theorem:

- a) If 1. can be solved in polynomial time, then 2. can be solved in polynomial time.
- b) If 2. can be solved in polynomial time, then 3. can be solved in polynomial time.

### Proof:

- a) Run 1. for values  $k=1..n$ . Instead of linear search one could also do binary search.
- b) Run 2. to find the size  $k_{opt}$  of a largest clique in  $G$ . Now check one edge after the other. Remove one edge from  $G$ , compute the new size of the largest clique in this new graph. If it is still  $k_{opt}$  then this edge is not necessary for a clique. If it is less than  $k_{opt}$  then it is part of the clique.

## Class of problems: NP

- Decision problems: answer YES or NO. E.g., "is there a tour of length  $\leq K$ " ?
- Solvable in *non-deterministic polynomial* time:
  - Intuitively: the solution can be **verified** in polynomial time
  - E.g., if someone gives us a tour  $T$ , we can verify in *polynomial* time if  $T$  is a tour of length  $\leq K$ .
- Therefore, the decision variant of TSP is in NP.

## Formal definitions of P and NP

- A decision problem  $\Pi$  is solvable in polynomial time (or  $\Pi \in P$ ), if there is a polynomial time algorithm  $A(\cdot)$  such that for any input  $x$ :  
 $\Pi(x) = \text{YES}$  iff  $A(x) = \text{YES}$
- A decision problem  $\Pi$  is solvable in **non-deterministic** polynomial time (or  $\Pi \in NP$ ), if there is a polynomial time algorithm  $A(\cdot, \cdot)$  such that for any input  $x$ :  
 $\Pi(x) = \text{YES}$  iff **there exists a certificate**  $y$  of size  $\text{poly}(|x|)$  such that  $A(x, y) = \text{YES}$

4/16/09

CS 5633 Analysis of Algorithms

13

## Examples of problems in NP

- Is “Does there exist a clique in  $G$  of size  $\geq k$ ” in NP?  
 Yes:  $A(x, y)$  interprets  $x$  as a graph  $G$ ,  $y$  as a set  $C$ , and checks if all vertices in  $C$  are adjacent and if  $|C| \geq k$
- Is **Sorting** in NP?  
 No, not a decision problem.
- Is “Sortedness” in NP?  
 Yes: ignore  $y$ , and check if the input  $x$  is sorted.

CS 5633 Analysis of Algorithms

14

## Reductions: $\Pi'$ to $\Pi$

4/16/09

CS 5633 Analysis of Algorithms

15

## Reductions: $\Pi'$ to $\Pi$

4/16/09

CS 5633 Analysis of Algorithms

16

## Reductions

- $\Pi'$  is *polynomial time reducible* to  $\Pi$  ( $\Pi' \leq \Pi$ ) iff there is a polynomial time function  $f$  that maps inputs  $x'$  for  $\Pi'$  into inputs  $x$  for  $\Pi$ , such that for any  $x'$

$$\Pi'(x') = \Pi(f(x'))$$

- Fact 1: if  $\Pi \in P$  and  $\Pi' \leq \Pi$  then  $\Pi' \in P$
- Fact 2: if  $\Pi \in NP$  and  $\Pi' \leq \Pi$  then  $\Pi' \in NP$
- Fact 3 (transitivity):

$$\text{if } \Pi'' \leq \Pi' \text{ and } \Pi' \leq \Pi \text{ then } \Pi'' \leq \Pi$$

4/16/09

CS 5633 Analysis of Algorithms

17

## Recap

- We defined a large class of interesting problems, namely NP
- We have a way of saying that one problem is not harder than another ( $\Pi' \leq \Pi$ )
- Our goal: show equivalence between hard problems

4/16/09

CS 5633 Analysis of Algorithms

18

## Showing equivalence between difficult problems

- Options:
  - Show reductions between all pairs of problems
  - Reduce the number of reductions using transitivity of " $\leq$ "

4/16/09

CS 5633 Analysis of Algorithms

19

## Showing equivalence between difficult problems

- Options:
  - Show reductions between all pairs of problems
  - Reduce the number of reductions using transitivity of " $\leq$ "
  - Show that *all* problems in NP are reducible to a *fixed*  $\Pi$ .

To show that some problem  $\Pi' \in NP$  is equivalent to all difficult problems, we only show  $\Pi \leq \Pi'$ .

4/16/09

CS 5633 Analysis of Algorithms

20

## The first problem $\Pi$

- Satisfiability problem (SAT):
  - Given: a formula  $\varphi$  with  $m$  clauses over  $n$  variables, e.g.,  $x_1 \vee x_2 \vee x_5, x_3 \vee \neg x_5$
  - Check if there exists TRUE/FALSE assignments to the variables that makes the formula satisfiable

4/16/09

CS 5633 Analysis of Algorithms

21

## SAT is NP-complete

- **Fact:**  $\text{SAT} \in \text{NP}$
- **Theorem [Cook'71]:** For any  $\Pi' \in \text{NP}$  we have  $\Pi' \leq \text{SAT}$ .
- **Definition:** A problem  $\Pi$  such that for any  $\Pi' \in \text{NP}$  we have  $\Pi' \leq \Pi$ , is called *NP-hard*
- **Definition:** An NP-hard problem that belongs to NP is called *NP-complete*
- **Corollary:** SAT is NP-complete.

4/16/09

CS 5633 Analysis of Algorithms

22

## Plan of attack:

(thanks, Steve ☺)  
Follow from Cook's Theorem

Conclusion: all of the above problems are NP-complete

4/16/09

CS 5633 Analysis of Algorithms

23

## Clique again

- Clique (decision variant):
  - **Input:** Undirected graph  $G=(V,E)$ , and an integer  $K \geq 0$
  - **Output:** Is there a clique  $C$ , i.e., a subset  $C$  of  $V$  such that every pair of vertices in  $C$  has an edge between them, such that  $|C| \geq K$ ?

4/16/09

CS 5633 Analysis of Algorithms

24

## SAT $\leq$ Clique

- Given a SAT formula  $\varphi = C_1, \dots, C_m$  over  $x_1, \dots, x_n$ , we need to produce  $G = (V, E)$  and  $K$ ,  $f(x') = x$  such that  $\varphi$  satisfiable iff  $G$  has a clique of size  $\geq K$ .
- Notation: a **literal** is either  $x_i$  or  $\neg x_i$

4/16/09

CS 5633 Analysis of Algorithms

25

## SAT $\leq$ Clique reduction

- For each literal  $t$  occurring in  $\varphi$ , create a vertex  $v_t$
- Create an edge  $v_t - v_{t'}$  iff:
  - $-t$  and  $t'$  are not in the same clause, and
  - $-t$  is not the negation of  $t'$

4/16/09

CS 5633 Analysis of Algorithms

26

## SAT $\leq$ Clique example

Edge  $v_t - v_{t'} \Leftrightarrow$ 

- $t$  and  $t'$  are not in the same clause, and
- $t$  is not the negation of  $t'$

- Formula:  $x_1 \vee x_2 \vee x_3, \neg x_2 \vee \neg x_3, \neg x_1 \vee x_2$
- Graph:

- Claim:**  $\varphi$  satisfiable iff  $G$  has a clique of size  $\geq m$

4/16/09

CS 5633 Analysis of Algorithms

27

## Proof

Edge  $v_t - v_{t'} \Leftrightarrow$ 

- $t$  and  $t'$  are not in the same clause, and
- $t$  is not the negation of  $t'$

- “ $\rightarrow$ ” part:
  - Take any assignment that satisfies  $\varphi$ .  
E.g.,  $x_1 = F, x_2 = T, x_3 = F$
  - Let the set  $C$  contain one satisfied literal per clause
  - $C$  is a clique

4/16/09

CS 5633 Analysis of Algorithms

28

## Proof

Edge  $v_i - v_j \Leftrightarrow$ 

- $t$  and  $t'$  are not in the same clause, and
- $t$  is not the negation of  $t'$

- “ $\leftarrow$ ” part:

- Take any clique  $C$  of size  $\geq m$  (i.e.,  $= m$ )

- Create a set of equations that satisfies selected literals.

E.g.,  $x_3=T, x_2=F, x_1=F$

- The set of equations is consistent and the solution satisfies  $\varphi$

## Altogether

- We constructed a reduction that maps:
  - YES inputs to SAT to YES inputs to Clique
  - NO inputs to SAT to NO inputs to Clique
- The reduction works in polynomial time
- Therefore,  $SAT \leq Clique \rightarrow Clique$  NP-hard
- $Clique$  is in NP  $\rightarrow Clique$  is NP-complete

## Independent set (IS)

- **Input:** Undirected graph  $G=(V,E)$
- **Output:** Is there a subset  $S$  of  $V$ ,  $|S| \geq K$  such that **no** pair of vertices in  $S$  has an edge between them? ( $S$  is called an *independent set*)

## Clique $\leq$ IS

- Given an input  $G=(V,E), K$  to Clique, need to construct an input  $G'=(V',E'), K'$  to IS,

$$f(x')=x$$

such that  $G$  has clique of size  $\geq K$  iff  $G'$  has IS of size  $\geq K'$ .

- Construction:  $K'=K, V'=V, E'=\bar{E}$
- Reason:  $C$  is a clique in  $G$  iff it is an IS in  $G'$ 's complement.

# Vertex cover (VC)

- Input: undirected graph  $G=(V,E)$ , and  $K \geq 0$
- Output: is there a subset  $C$  of  $V$ ,  $|C| \leq K$ , such that each edge in  $E$  is incident to at least one vertex in  $C$ .

# IS $\leq$ VC

- Given an input  $G=(V,E), K$  to IS, need to construct an input  $G'=(V',E'), K'$  to VC, such that  $f(x')=x$

$G$  has an IS of size  $\geq K$  iff  $G'$  has VC of size  $\leq K'$ .

- Construction:  $V'=V, E'=E, K'=|V|-K$
- Reason:  $S$  is an IS in  $G$  iff  $V-S$  is a VC in  $G$ .
