CS 5633 Analysis of Algorithms

Order statistics

Select the *i*th smallest of *n* elements (the element with *rank i*).

- i = 1: minimum;
- i = n: maximum;
- $i = \lfloor (n+1)/2 \rfloor$ or $\lceil (n+1)/2 \rceil$: **median**.

Naive algorithm: Sort and index *i*th element. Worst-case running time = $\Theta(n \log n) + \Theta(1)$ = $\Theta(n \log n)$,

using merge sort or heapsort (not quicksort).

Randomized divide-andconquer algorithm

```
RAND-SELECT(A, p, q, i) \triangleleft ith smallest of A[p..q] if p = q then return A[p] r \leftarrow \text{RAND-PARTITION}(A, p, q) k \leftarrow r - p + 1 \triangleleft k = \text{rank}(A[r]) if i = k then return A[r] if i < k then return RAND-SELECT(A, p, r - 1, i) else return RAND-SELECT(A, r + 1, q, i - k) \longleftarrow k \longrightarrow \bowtie k \longrightarrow \bowtie k \longrightarrow k \longrightarrow \bowtie k \longrightarrow
```

CS 5633 Analysis of Algorithms

q

3

Example

Select the i = 7th smallest:

Partition:

Select the 7 - 4 = 3rd smallest recursively.

CS 5633 Analysis of Algorithms

🌉 Intuition for analysis

(All our analyses today assume that all elements are distinct.)

Lucky:

$$T(n) = T(9n/10) + \Theta(n)$$
 $n^{\log_{10/9} 1} = n^0 = 1$
= $\Theta(n)$ CASE 3

Unlucky:

$$T(n) = T(n-1) + \Theta(n)$$
 arithmetic series
= $\Theta(n^2)$

Worse than sorting!

Analysis of expected time

The analysis follows that of randomized quicksort, but it's a little different.

Let T(n) = the random variable for the running time of RAND-SELECT on an input of size n, assuming random numbers are independent.

For k = 0, 1, ..., n-1, define the *indicator* random variable

$$X_k = \begin{cases} 1 & \text{if PARTITION generates a } k : n-k-1 \text{ split,} \\ 0 & \text{otherwise.} \end{cases}$$

2/4/10

CS 5633 Analysis of Algorithms

Solution Analysis (continued)

To obtain an upper bound, assume that the *i* th element always falls in the larger side of the partition:

$$T(n) = \begin{cases} T(\max\{0, n-1\}) + \Theta(n) & \text{if } 0 : n-1 \text{ split,} \\ T(\max\{1, n-2\}) + \Theta(n) & \text{if } 1 : n-2 \text{ split,} \\ \dots & \\ T(\max\{n-1, 0\}) + \Theta(n) & \text{if } n-1 : 0 \text{ split,} \end{cases}$$

$$= \sum_{k=0}^{n-1} X_k \left(T(\max\{k, n-k-1\}) + \Theta(n) \right)$$

$$\leq 2 \sum_{k=\lfloor n/2 \rfloor}^{n-1} X_k \left(T(k) + \Theta(n) \right)$$

2/4/10

CS 5633 Analysis of Algorithms

Calculating expectation

$$E[T(n)] = E\left[2\sum_{k=\lfloor n/2\rfloor}^{n-1} X_k(T(k) + \Theta(n))\right]$$

Take expectations of both sides.

2/4/10

CS 5633 Analysis of Algorithms

Calculating expectation

$$E[T(n)] = E\left[2\sum_{k=\lfloor n/2\rfloor}^{n-1} X_k \left(T(k) + \Theta(n)\right)\right]$$
$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k \left(T(k) + \Theta(n)\right)]$$

Linearity of expectation.

2/4/10

CS 5633 Analysis of Algorithms

9

11

Calculating expectation

$$E[T(n)] = E\left[2\sum_{k=\lfloor n/2\rfloor}^{n-1} X_k (T(k) + \Theta(n))\right]$$

$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k (T(k) + \Theta(n))]$$

$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k] \cdot E[T(k) + \Theta(n)]$$

Independence of X_k from other random choices.

2/4/10

CS 5633 Analysis of Algorithms

Calculating expectation

$$E[T(n)] = E\left[2\sum_{k=\lfloor n/2\rfloor}^{n-1} X_k (T(k) + \Theta(n))\right]$$

$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k (T(k) + \Theta(n))]$$

$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k] \cdot E[T(k) + \Theta(n)]$$

$$= \frac{2}{n}\sum_{k=\lfloor n/2\rfloor}^{n-1} E[T(k)] + \frac{2}{n}\sum_{k=\lfloor n/2\rfloor}^{n-1} \Theta(n)$$

Linearity of expectation; $E[X_k] = 1/n$.

2/4/10

CS 5633 Analysis of Algorithms

Calculating expectation

$$E[T(n)] = E\left[2\sum_{k=\lfloor n/2\rfloor}^{n-1} X_k (T(k) + \Theta(n))\right]$$

$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k (T(k) + \Theta(n))]$$

$$= 2\sum_{k=\lfloor n/2\rfloor}^{n-1} E[X_k] \cdot E[T(k) + \Theta(n)]$$

$$= \frac{2}{n}\sum_{k=\lfloor n/2\rfloor}^{n-1} E[T(k)] + \frac{2}{n}\sum_{k=\lfloor n/2\rfloor}^{n-1} \Theta(n)$$

$$= \frac{2}{n}\sum_{k=\lfloor n/2\rfloor}^{n-1} E[T(k)] + \Theta(n)$$

2/4/10 CS 5633 Analysis of Algorithms 12

10

Hairy recurrence

(But not quite as hairy as the quicksort one.)

$$E[T(n)] = \frac{2}{n} \sum_{k=|n/2|}^{n-1} E[T(k)] + \Theta(n)$$

Prove: $E[T(n)] \le cn$ for constant c > 0.

• The constant c can be chosen large enough so that $E[T(n)] \le cn$ for the base cases.

Use fact:
$$\sum_{k=\lfloor n/2 \rfloor}^{n-1} k \le \frac{3}{8}n^2$$
 (exercise)

2/4/10

CS 5633 Analysis of Algorithms

Substitution method

$$E[T(n)] \le \frac{2}{n} \sum_{k=|n/2|}^{n-1} ck + \Theta(n)$$

Substitute inductive hypothesis.

2/4/10

CS 5633 Analysis of Algorithms

14

16

Substitution method

$$E[T(n)] \le \frac{2}{n} \sum_{k=\lfloor n/2 \rfloor}^{n-1} ck + \Theta(n)$$
$$\le \frac{2c}{n} \left(\frac{3}{8}n^2\right) + \Theta(n)$$

Use fact.

2/4/10

Substitution method

$$E[T(n)] \le \frac{2}{n} \sum_{k=\lfloor n/2 \rfloor}^{n-1} ck + \Theta(n)$$
$$\le \frac{2c}{n} \left(\frac{3}{8}n^2\right) + \Theta(n)$$
$$= cn - \left(\frac{cn}{4} - \Theta(n)\right)$$

Express as *desired – residual*.

15

13

CS 5633 Analysis of Algorithms

2/4/10

CS 5633 Analysis of Algorithms

Substitution method

$$E[T(n)] \le \frac{2}{n} \sum_{k=\lfloor n/2 \rfloor}^{n-1} ck + \Theta(n)$$

$$\le \frac{2c}{n} \left(\frac{3}{8}n^2\right) + \Theta(n)$$

$$= cn - \left(\frac{cn}{4} - \Theta(n)\right)$$

$$\le cn,$$

if c is chosen large enough so that cn/4 dominates the $\Theta(n)$.

2/4/10

CS 5633 Analysis of Algorithms

17

Summary of randomized order-statistic selection

- Works fast: linear expected time.
- Excellent algorithm in practice.
- But, the worst case is *very* bad: $\Theta(n^2)$.
- **Q.** Is there an algorithm that runs in linear time in the worst case?
- **A.** Yes, due to Blum, Floyd, Pratt, Rivest, and Tarjan [1973].

IDEA: Generate a good pivot recursively.

18

2/4/10 CS 5633 Analysis of Algorithms

ALGORITHMS

Worst-case linear-time order statistics

Select(i, n)

- 1. Divide the *n* elements into groups of 5. Find the median of each 5-element group by rote.
- 2. Recursively SELECT the median x of the $\lfloor n/5 \rfloor$ group medians to be the pivot.
- 3. Partition around the pivot x. Let k = rank(x).
- 4. if i = k then return x elseif $i \le k$

then recursively SELECT the *i*th smallest element in the lower part else recursively SELECT the (*i*–*k*)th smallest element in the upper part

Same as RAND-SELECT

2/4/10 CS 5633 Analysis of Algorithms

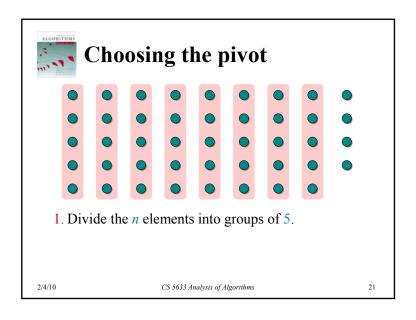

19

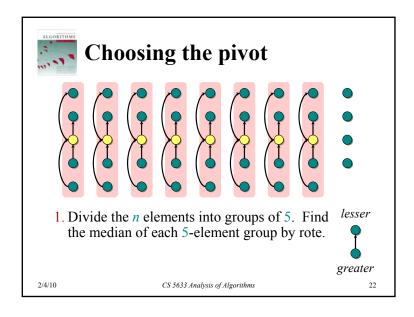

Choosing the pivot

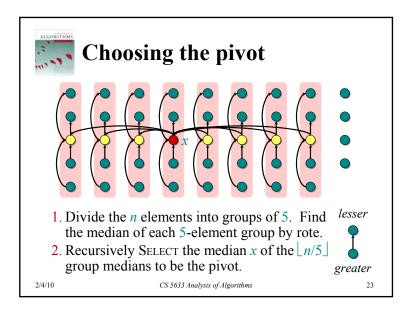

Choosing the pivot

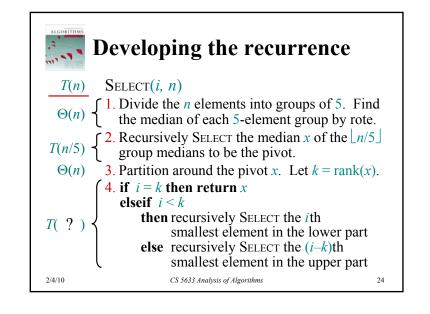

CS 5633 Analysis of Algorithms

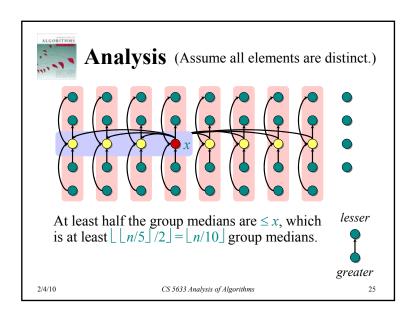

20

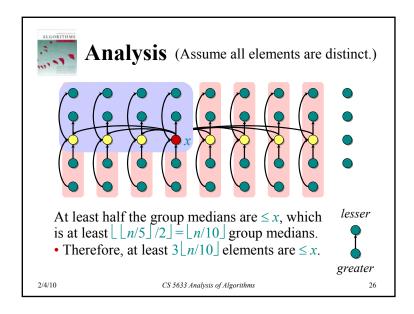

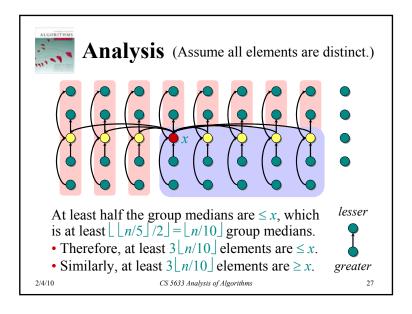

Analysis (Assume all elements are distinct.)

Need "at most" for worst-case runtime

- At least $3 \lfloor n/10 \rfloor$ elements are $\leq x$ \Rightarrow at most $n-3 \lfloor n/10 \rfloor$ elements are $\geq x$
- At least $3 \lfloor n/10 \rfloor$ elements are $\geq x$ \Rightarrow at most $n-3 \lfloor n/10 \rfloor$ elements are $\leq x$
- The recursive call to SELECT in Step 4 is executed recursively on $n-3 \lfloor n/10 \rfloor$ elements.

2/4/10 CS 5633 Analysis of Algorithms

28

Analysis (Assume all elements are distinct.)

- Use fact that $\lfloor a/b \rfloor \ge ((a-(b-1))/b)$ (page 51)
- $n-3 \lfloor n/10 \rfloor \le n-3 \cdot (n-9)/10 = (10n -3n +27)/10$ $\le 7n/10 + 3$
- The recursive call to SELECT in Step 4 is executed recursively on at most 7n/10+3 elements.

2/4/10

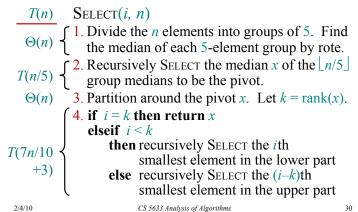

CS 5633 Analysis of Algorithms

29

31

Developing the recurrence

Solving the recurrence

for $\Theta(n)$

$$T(n) = T\left(\frac{1}{5}n\right) + T\left(\frac{7}{10}n + 3\right) + \frac{dn}{dn}$$

Substitution: $T(n) \le c(\frac{1}{5}n-4) + c(\frac{7}{10}n+3-4) + dn$ $T(n) \le c(n-4)$

 $T(n) \le c(n-4)$ Technical trick. This shows that $T(n) \in O(n)$

$$\leq \frac{9}{10}cn - 4c + dn$$

$$= c(n-4) - \frac{1}{10}cn + dn$$

$$\leq c(n-4)$$

if c is chosen large enough, e.g., c=10d

2/4/10 CS 5633 Analysis of Algorithms

Conclusions

- Since the work at each level of recursion is basically a constant fraction (9/10) smaller, the work per level is a geometric series dominated by the linear work at the root.
- In practice, this algorithm runs slowly, because the constant in front of *n* is large.
- The randomized algorithm is far more practical.

Exercise: *Try to divide into groups of 3 or 7.*
